

Modernize & Secure Your Network with SASE

SUMMIT
TECHNOLOGY GROUP

SASE combines two powerful solutions – SD-WAN and Secure Service Edge (SSE) – that transform a business’ WAN for today’s distributed enterprise and workforce landscapes

SASE features

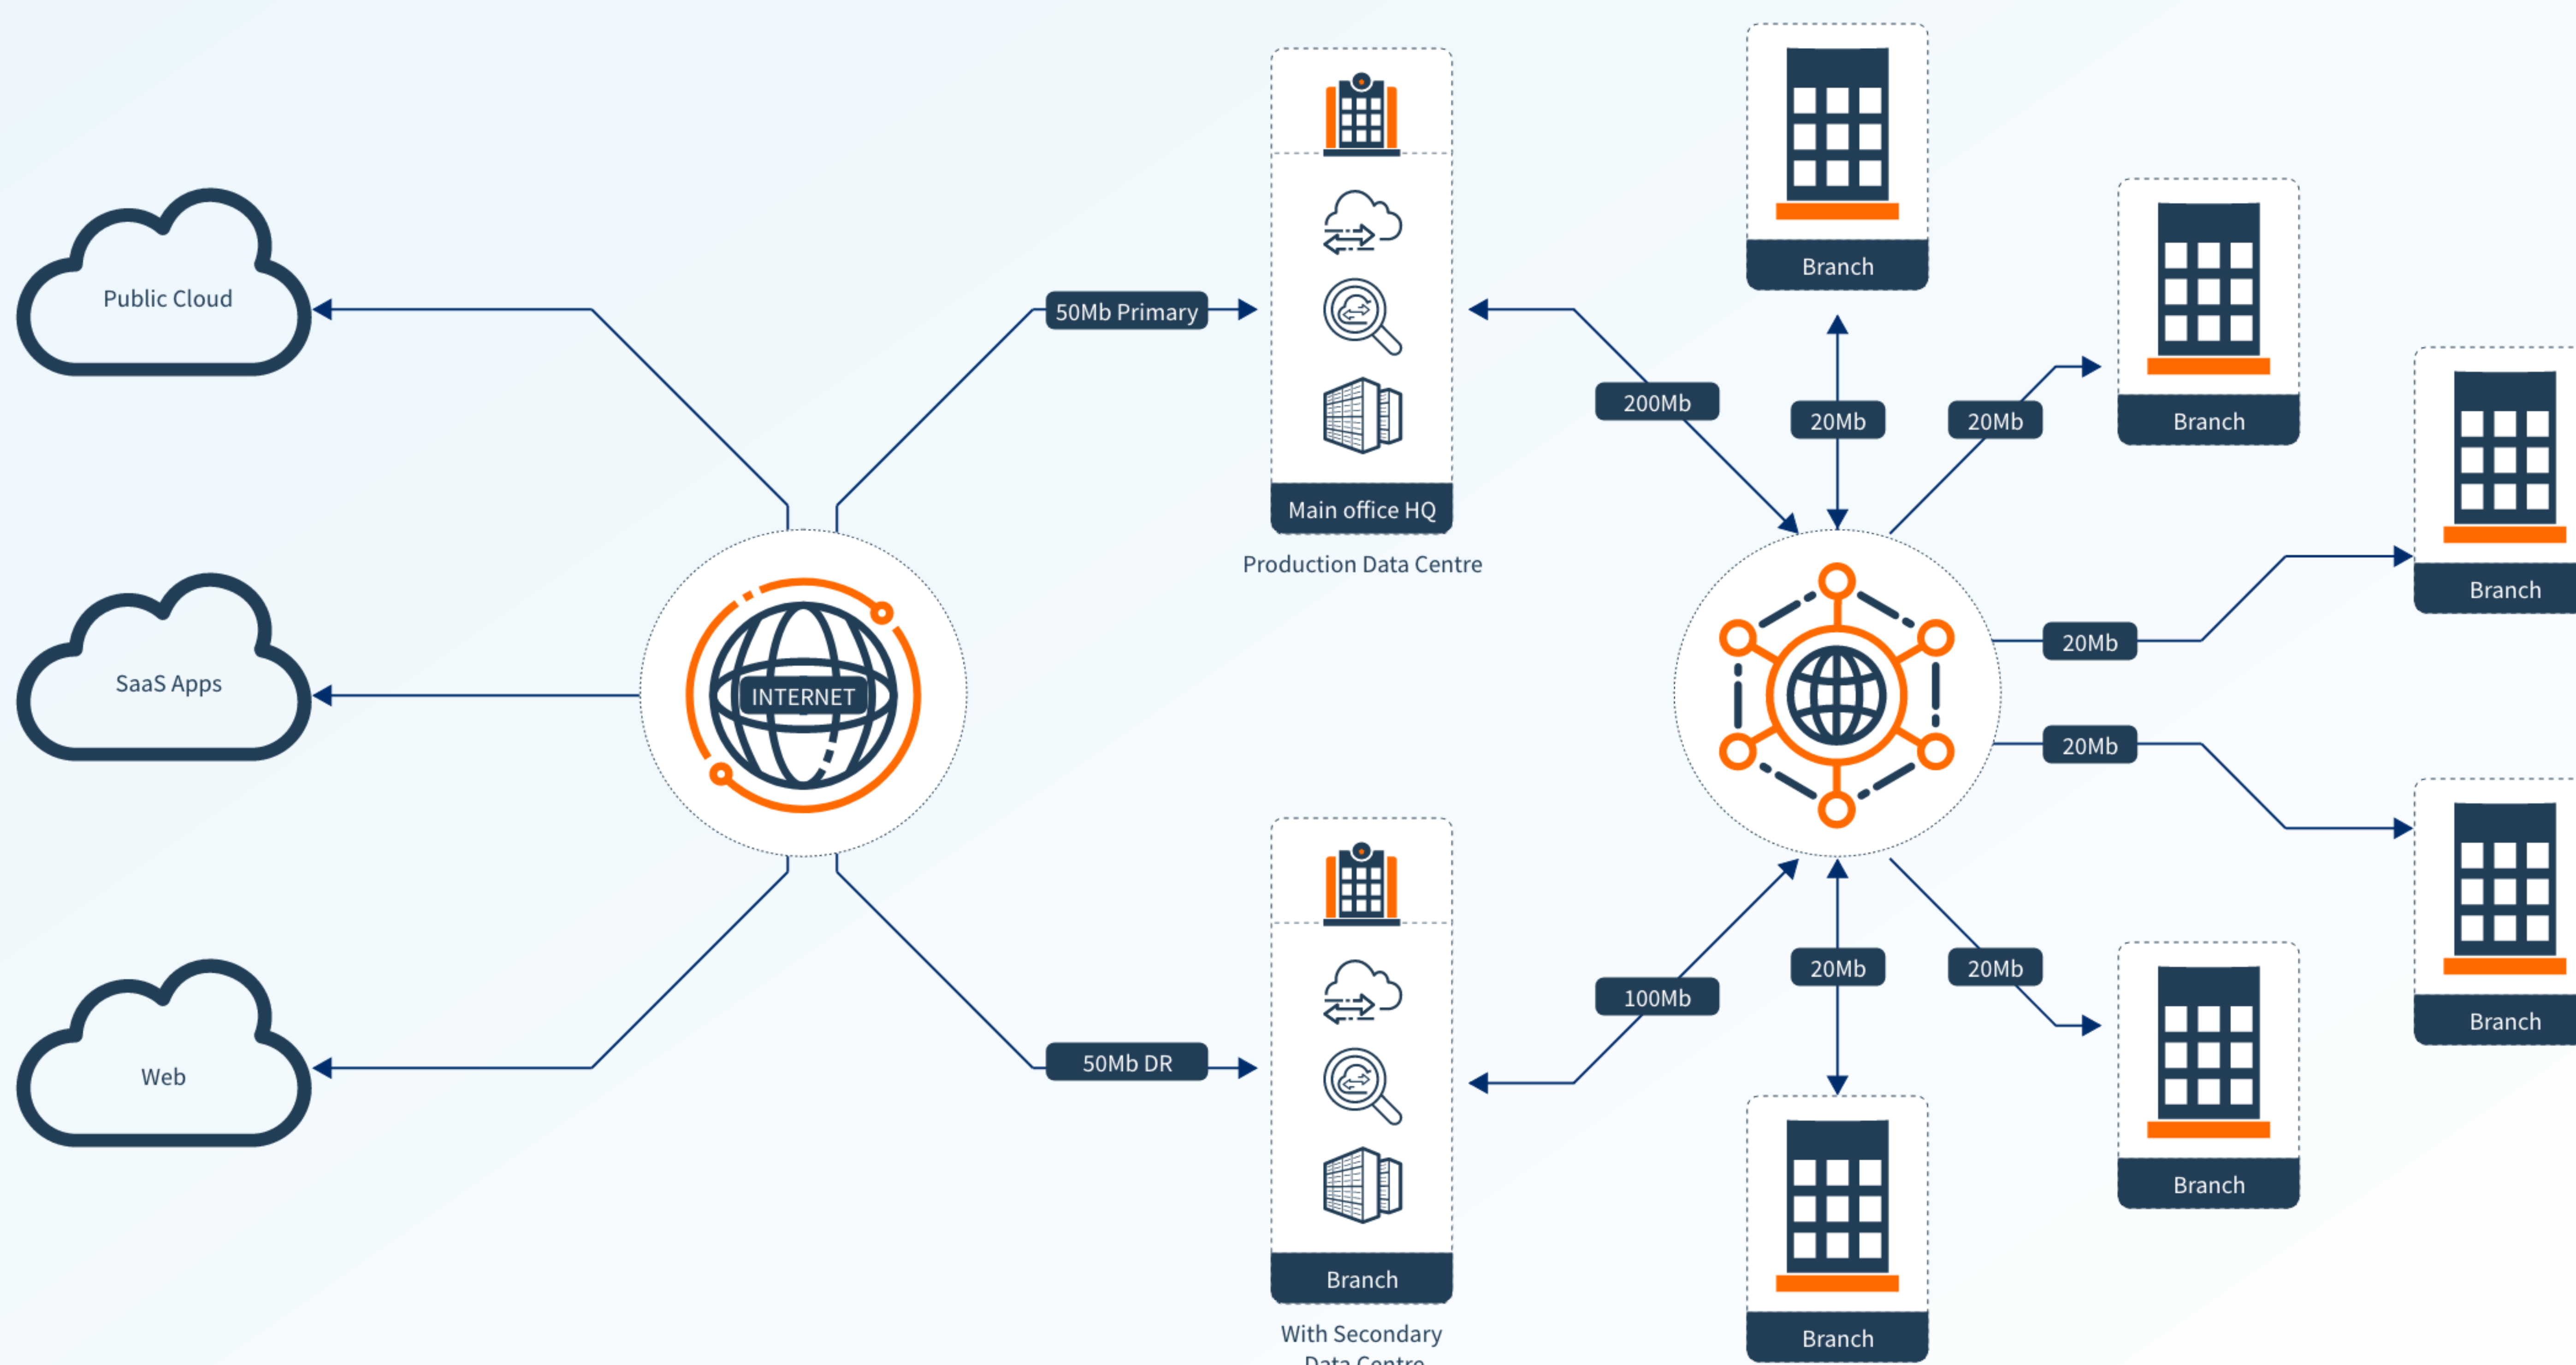

SD-WAN simplifies and optimizes your WAN by routing traffic across multiple lower cost broadband circuits. It uses a centralized, policy-based management that allows a customer to push changes or add new locations with ease. Firewall and IDS/IPS can be distributed to each branch office.

SSE secures internet traffic, which is critical with the explosion of SaaS applications. It’s based on a zero-trust foundation and includes features such as Secure Web Gateways.

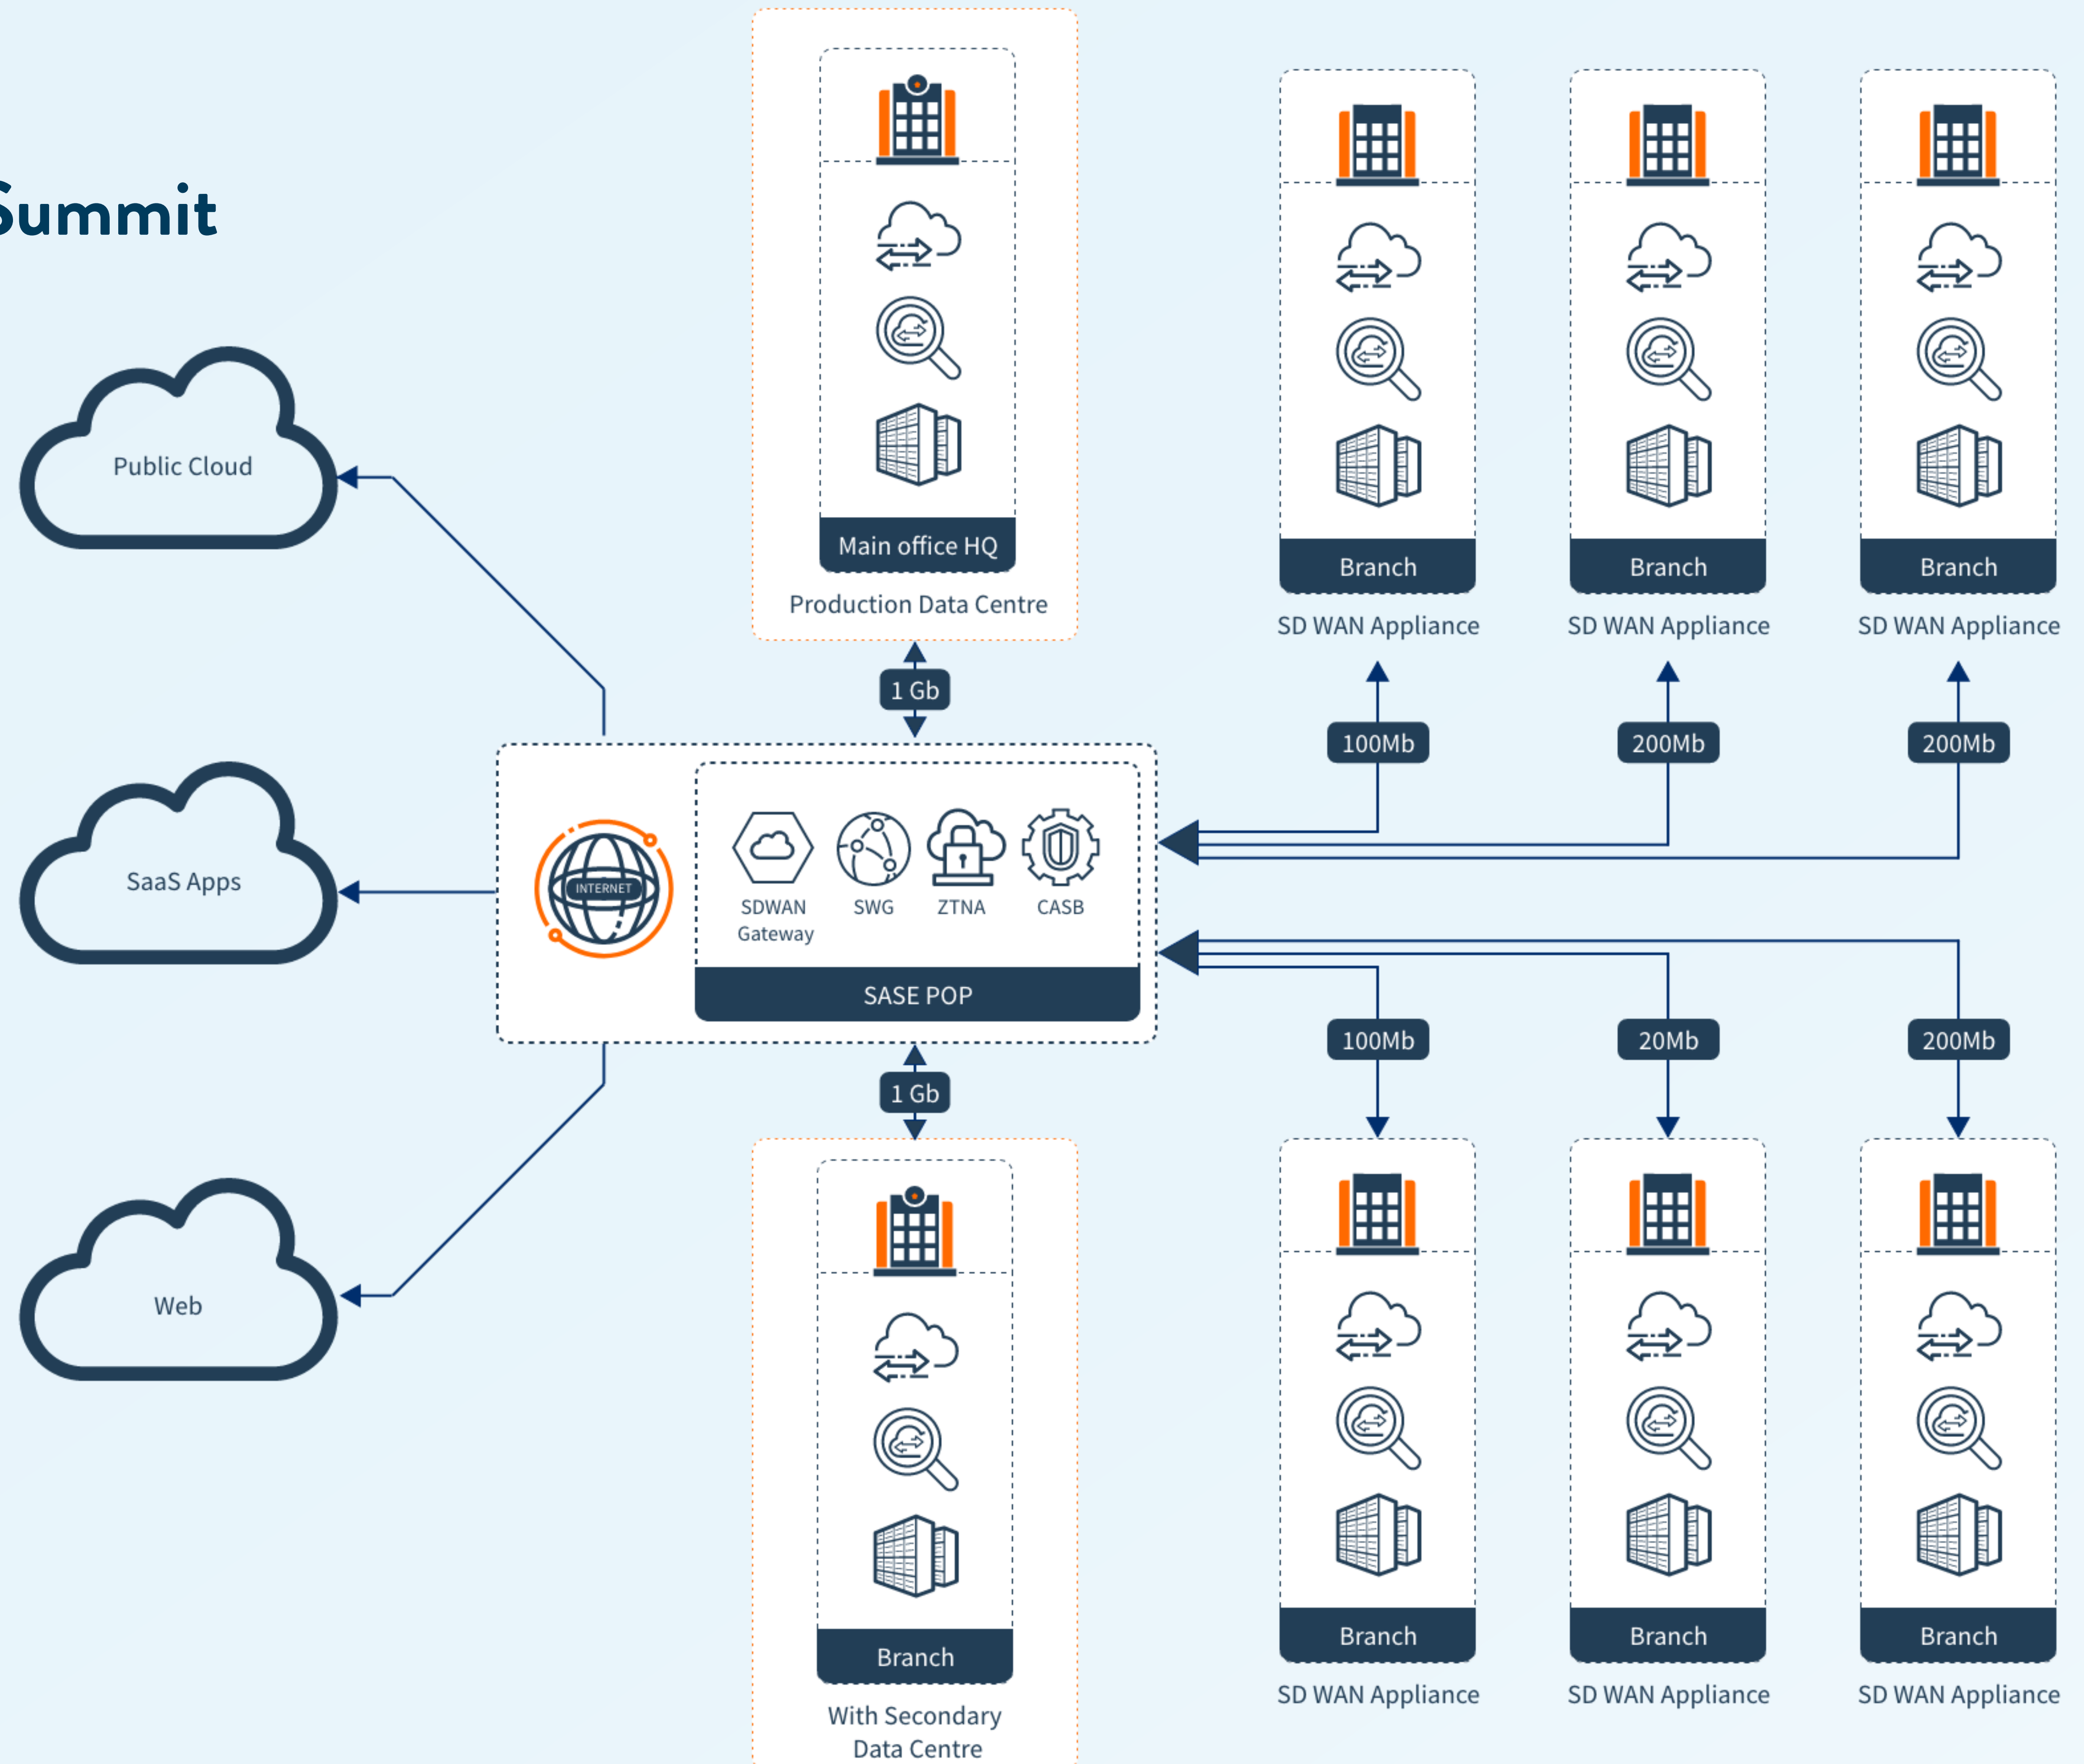

Challenges with legacy network architectures:

- Private WAN circuits are expensive
- Complex to manage and scale as business grows
- Poor user experience with increase in distributed applications and remote workforce

Benefits of SASE from Summit

- Increase WAN flexibility, resiliency, performance
- Scalable security for internet, cloud, and SaaS application traffic
- Reduce administrative overhead

STG Managed Services For SASE

**Extension
of your team**

**Ownership
Mentality**

**Full-service
Approach**

**Focus on
Core Competency**

Summit offers a 24/7 managed service for our SASE customers. Let our global team handle the monitoring and management of your WAN and have your team focus on business value activities.

For a simple, per-location fee our service provides:

- 24x7 monitoring and issue escalation
- Daily system reviews
- Periodic health checks with customer
- System maintenance
- And more!
